

Crowther OS Sprint 1

1. We need to fix the design for these phases in texting, so it looks like a filter, not like different tabs.

2.

Tasks

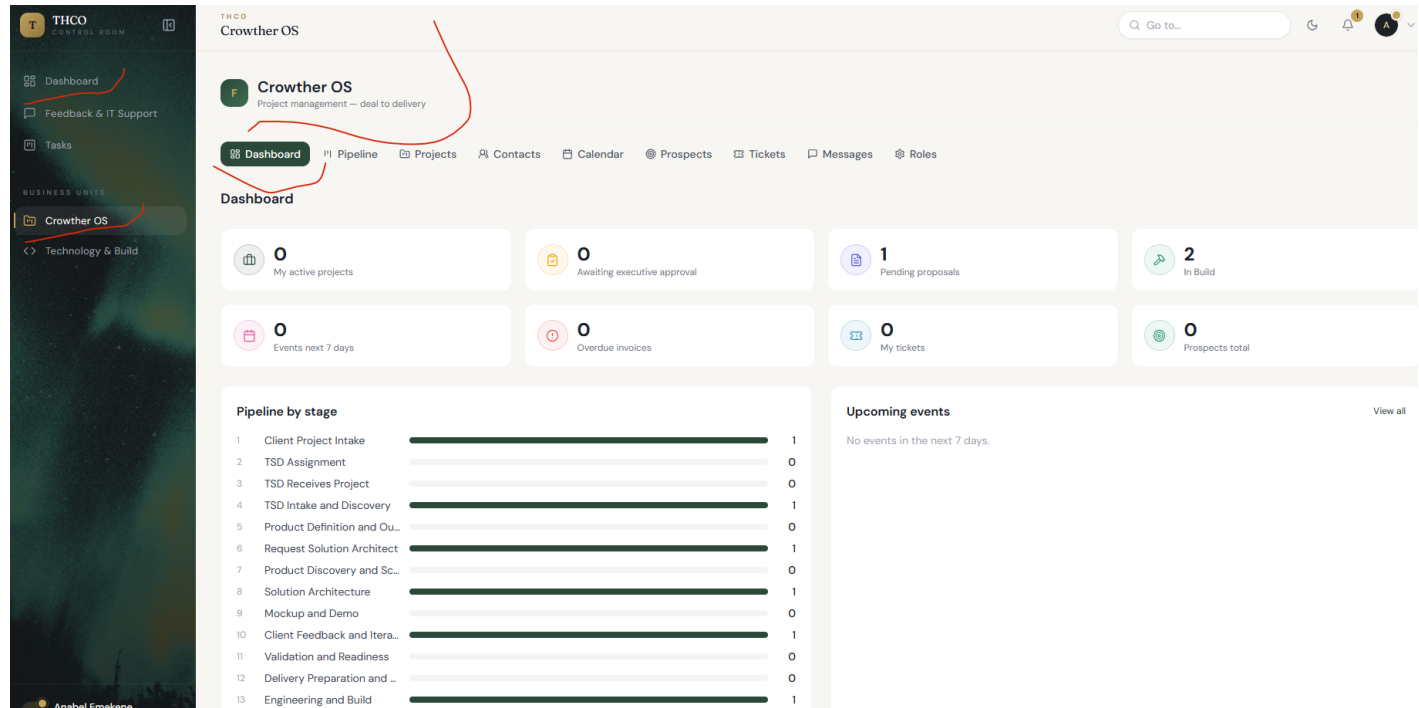

3. We need to also look into the demo, the whole demo flow. We will create a demo round, and then we have to refresh, and we have to go and find the button again. That doesn't fly. Also, what is the 'iterate' about? Also as seen in the screenshot above, It's asking for "demo round creator of materials." But how are we supposed to have a demo around creating materials when which materials, where do we upload them? Those are now set up new wireframes, prototypes, we don't have that. That should be somewhere in the products stage. Whether you know that we've now got into the pod creation.

How do we have the wireframes then? If even if we are going to have the solution architects do a demo with emergent or other app builders, where would that happen? Where would the materials be added to?

The other things, materials are going to be added when we create them around. As I've said before, there's nothing there. So what's the flow for that? Why am I being held up even after clicking that "demo has been held with the client"?

4. We need to remove all those previous business units That were in the sidebar.

DESCRIPTION
What do you need to do? What is this about? Creating certain cloud and connecting to MTN server

Now this means, that this stage need to revamped - If the SP has chosen a TSD from the original form, project creation form, remember I said edit the "who staffed" section on the form, project creation form. Would edit that to tease the selection. So if the SP has chosen a TSD there, then stay true. We marked complete.

Else, the stage two and TSD assignments will remain. That'll help if he has not decided on who the CSD will be. By the way, there is the advanced anyway message there. That says "senior partner will be emailed." That message should be edited based on what account it is. For example, the screenshot was taken from within the SBA account.

Obviously, SP has full abilities to do advanced or reverse. The message should be edited properly.

Chidi Bello now manages this project

Also when changing the TSD. Within that TSD dropdown, there's nothing to change the TSD card "that has been assigned." That is at the top of the form.

7.

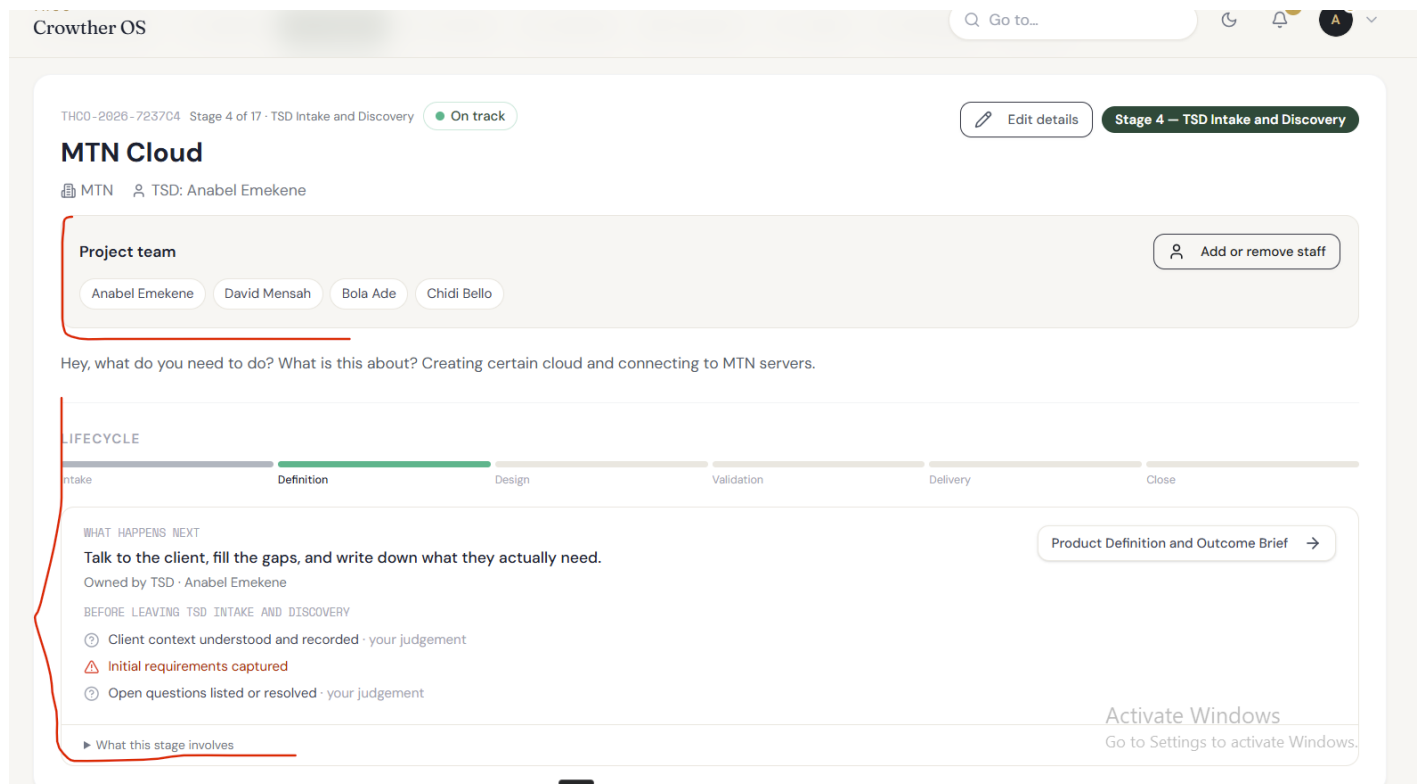

Although, I think we should remove the first stage and the third stage of the intake. We need to remove the third stage of that, because MTSD accepts to project something. Let's do this. Because something would happen in between.

We would change it such that in each phase (like the intake phase), you can see if there are three stages, there are three divisions in Tiga (three markings) so that we can see that, even though we are within that stitch, you can see a line or something moving across the stages. Something like you can do a "numeral line" type of thing where there are markers in each phase. There are markers for the stages, and so you can sort of see where the marker is, where the nine is on those markers. It moves across like that while the face is still coloured.

- Completed face is coloured gold.
- Current face is coloured green.
- Dump face is coloured grey.

Or, actually, you can leave the colours like this, but let the markers be done. So you can see within a face, the stitches are moving in a number line type of thing, small dashes with a slightly bigger dash showing where the project is right now.

8. Project section design changes

2. Make Overview the main section users see when they open a project. The project description and related information currently displayed elsewhere should be moved into Overview.
3. Move the lifecycle to the top, directly below the project name. It should be a simple horizontal roadmap line using the phase and stage markers described above, so users can immediately see where the project is in its lifecycle.
4. Keep only the lifecycle line visible by default. When users hover over or click a marker, show the relevant details, including what the current stage involves and what happens next. Those details should disappear when they move away.
5. Put a small button beside the lifecycle line for advancing the project to the next stage. The existing flow for advancing should remain the same. If the project isn't ready to advance, the existing popup should appear and require the appropriate reason or information.
6. Remove the separate client section from the main page. Client/contact management can instead be represented by a Contacts icon alongside the other icons at the top. Clicking that icon should open the relevant functionality.
7. Keep the current client creation button available at the bottom of the Overview section as well.

Overall, when someone opens a project, the page should primarily be the Overview/Product Build section. The lifecycle becomes a compact line at the top, contacts become an icon, and the other separate sections should be removed or consolidated so they don't compete with the main project content. Also, in the overview page, it should be dynamic according to the stage of the project. For example, when you request the social architect stage, the overview page will have a button to click on "Request Social Architect" to send a notification to the SP, that you as the TSD has requested a social architect for this particular project, which means you've done all the prior stages, and you are the point where you need the social updates coming. You start scoping it and creating the pods, etc.

Crowther Delivery Suite 1.png

Ayo Omomia · Aug 21, 2026

v1

When i click on the link for this image, it redirected back to the frontend landing page/dashboard page, we need a download link, and a preview of any image or document uploadded, there on the architectures tab. Also, upon uploading anything, it just refreshes the entire page, which shouldnt be the solution (use react components or sumn)

Also, for user journeys, there is no way to update the user journey. What's the intended flow for that? What do you recommend as intended flow for that?

What the client asked for

That the project is built, duhhh

No Product Brief yet. It is written on the Product tab, and stage 5 waits for it.

Activate Windows
Go to Settings to activate Windows.

How do we do requirements ooooo?? nawa ooo. chai

Also, 'product brief will be written on the Product tab', but there is no such thing in the product tab. also what does 'requirements committed' mean and how do we commit, to go from the 'proposed' tag showing on the added requirement

Also, For the request solution architect, parts/section/stage, what's the recommended flow? Because there is no way to select, so you want to request. And even as the SP, there's no way to actually add a solution after it. So it shouldn't not be part of the stock once the breaks as I stitch? If you select what to choose who in the engineering team is solution architect for that project, which, from where they come home, to the rest of the process.

Hey, what do you need to do? What is this about? Creating certain cloud and connecting to MTN servers.

► What this stage involves

Solution Architecture →

There is also this issue as well, we cant 'refine requirements' and 'define user journeys' on the product tab yet.

IN STAGE 10 there should also be a 'back to stage 9' button as planned.
