Meeting - Transcript

00:00:00

Joshua Ayo Omomia: to do on the call is talk through it together. I would share a bit of how I'm seeing it over from my perspective and then we'll just finish it a bit better from there and then take it to the next step. Now this project in particular is a continuation from what we have internally which is the um uh the CRM uh which I believe Victor you are the one leading that that build correct

Timothy Victor: Yes, sir.

Joshua Ayo Omomia: all right okay now before I even go on the CRM is currently live is there is everyone already acquainted with it especially from the delivery

Timothy Victor: The only thing the delivery team is done there is just to add project but I've already worked them through the through the CRM how to operate on it but it's already they've added so I don't think they've started doing anything on talent

Joshua Ayo Omomia: on talent and let's even technology project is even the first one.

Timothy Victor: It's

Joshua Ayo Omomia: So maybe one thing that can help is after the call you can just or maybe when we're done having this conversation you can show success because success was away for a while and then you can also so show um a maker who who just joined us a bit more recently.

00:01:14

Timothy Victor: okay sir.

Joshua Ayo Omomia: Uh but as I said yeah but what we want to do as I mentioned is a continuation of that. Now one key thing that has been that has been more of a

bottleneck internally has been information dissemination. Uh and so one of the key things I did was over the weekend I just used chatbt. I I I further modified it today to kind of detail more like an architecture flow of some key processes that we use so that we can use technology to automate it and to make it a system. Now this is going to live within the CRM. So it's not going to be outside the CRM. uh but it's what it will do for us is it makes our entire project flow a bit more easier and then we know what to do across next step and next step and then the system moves in that direction. Now I would share this document with us this uh big picture that we see here.

00:02:15

Joshua Ayo Omomia: Um but before I go on let me quickly just explain what the structure looks like and what the system would be. Now the big picture is how do we solve the current bottleneck of information dissemination especially when it comes from the client as it stands now what mostly happens because of I'm leading a lot of the sales efforts I start conversations with the client they seem interested in what we're doing and then it goes right into our funnel but as you know some of these conversations I have them across multiple channels sometimes is in person sometimes times I meet them on WhatsApp. I mean I talk with them on WhatsApp. Sometimes we jump on a Google meet, sometimes you jump on a zoom meet. It's just several several um avenues in which we interact. Now there is always that flow from when that interaction has happened. We need to take it across the value chain of the company so that it can reach the outcome of the clients. And that's what we want to build here.

00:03:20

Joshua Ayo Omomia: Our standard flow as an organization is that there is always some form of um intake or some form of of documents and I don't I think I missed that one here in the diagram but the main point here is at the initial um um start of the project there is information okay so here uh I put maybe maybe a transcript script or

um a brief summary of what they want to do and all of those things that now moves to the next stage which is going to be like an intake and discovery stage. All right. And then it moves you know on and on and on. Uh to make this a bit more feasible let me show you one of the things I just did a quick wireframe on. So how I really want it to start is that when you come here it would um when you come here you put I can come and put a new project however the form that I've received that information I put the project's name which is the what they want us to solve maybe banking project I put the client's name if there's a template that we can pick from I pick it from here because we'll be saving templates that we would build the systems on especially if they are similar projects.

00:04:46

Joshua Ayo Omomia: I come here. If it's a custom technology project, maybe something we don't have a template for. I put the outcome. I put the brief that was shared here. Then I put things like the transcript and documents. Now once I send this, the main goal is that it's meant to trigger the next step. And the next step is meant to trigger is that it auto. Okay, let me still share on that on that part. Just give me a second. is meant to trigger the next step. But the next step is that a TCD member, let me restart this. Hold on. Emergency is sleeping. So, let me let me wake it back up. Yeah. So while it while it loads up but the main point is that it goes all the way from how we've received it from there it goes to the next step of the process which in most.

00:05:57

Joshua Ayo Omomia: case. So these are terminologies which again I will share with all of you during our um our yearly retreat which will happen in September. But TCD tsd is the delivery team up there. It goes to them then it moves to the next stage and the next stage and I'll explain that very shortly. Okay. up. All right. So it goes to the next stage for the TCD person and what the person sees here immediately is that the

project comes to their dashboard and two things they get an email for them to know with the summary and they can come here and then they can see it from this based on some prompt instructions that I've already given the system. uh it then summarizes that information and then you are able to signify the stage that it is in that's the TSD now the delivery folks up if is at intake because after every project they meant to have an intake um if it's a discovery if it's now moved for us to build the architecture for us to do a demo for us to do um whether the then start the build itself the QA you know the client accept us and then complete it.

00:07:15

Joshua Ayo Omomia: You move it across there and this also now interacts with our project dashboard of some sort that we have already in the system which we already have that we're using now. So this interacts with it. Now as this proceeds across the different timelines or the different stages of the project um it is being updated and that will be done a lot by the delivery team. The delivery team updates the progress of the project. However, there's always going to be a role that we coin as the solution architect or the project tech lead. The way we will be doing our projects going forward is that for every project that we do, there's always someone within the team that will serve as the solution architect and the project tech lead. Now this will this could be this will be randomly selected by me for now. um it could be based on domain, based on experience, based on familiarity on the project, but that person will be in charge of building out the solution architecture and also work with the tsd team on the type of team members that are required for the project.

00:08:26

Joshua Ayo Omomia: Um and then it's now important that once that is done then the person will be paired with other team members within the team the frontier team to build out the thing in coordination with um the the product designers and and all of

that and I'll talk a bit more on that. But here on the product person, the person is also able to see this. is also able to let me go back to that document cuz this doesn't show this doesn't show it properly and I may need to readjust was the wireframe. But the way the process will go is that once that information is received from me or from members from the commercial team, it goes into um this intake and discovery funnel more or less. There the TSD member receives a brief about the client and what to expect next. The TSD might then go back to the client. We call client PC. I go back to the PC to ask more information about the project and then keep updating the documents.

00:09:40

Joshua Ayo Omomia: Once that is then done, then it comes here for us to then um select who would be the solution architect or the project tech lead for that project. Once that is done, they are both involved in project product discovery and scoping. So the person scopes out based on the information that they've received from the client and maybe from myself or from anybody that has the product context and we will build a mockup. Now we might either do a mockup with things like emergent or our own app builder when that's ready when that mockup is done. All right. Um again based off the solution architecture defining the the architecture the the structure all of those things. Uh we then do a demo to the client for them to see the mockup and align if this works with them. Once we do the demo and they are fine with it then we start building. All right we start building. Now this is more on the commercial side the documents.

00:10:45

Joshua Ayo Omomia: So this moves to another unit to finalize that. But for the tech team once they finalized on the demo we move right to start building right here and you as you can see all the people involved. Once we are done building back and forth we then do QA testing then there's an acceptance. So the users do their own testing as

the clients use their own testing. There's an acceptance and we close out the entire project. Okay. Now what I want us to do is this thing this process flow is now going to be imbued right into our system that across different um levels it moves from that stage to another. One thing I've also done is you are able to see some form of documentation. So you can use this also for your scope building that mostly explains a bit more detailed everything about the uh about the the entire solution. So why we're doing it, the the objective, the steps, the principles. This is a bit more detailed about what goes from stage one to stage two and what then moves in that sense how the TSD sees it what steps in all of those things and I'll share this with us here all right and then we can then see what I've um done as a mockup and wireframe just to now build that properly from what we've done the end goal really is once information comes from whatever source we should be able to impute it in the

00:12:25

Joshua Ayo Omomia: system that information with the client client's names, client details, all of those things. And then the system automatically takes it across the next level. It picks a tsd to manage it. Um there's there's a grading and scoring system on how it will pick the tsd that is in the document. So it picks it on how to manage it. Then the tsd has can have a further conversation with the client to get more scope around what they want. Then the TSD shares it with the solution architect um or the project team lead that is leading the project and the person then uses that information that they've received to scope out the full sense of the project. So they watch the videos, they see the transcript, all of those things. And when they've scoped out a demo very quickly, uh we can use our Atom code to quickly do a demo so they can see it. The client sees the demo and tells you, "Okay, I want this added. I want this adjusted.

00:13:21

Joshua Ayo Omomia: I want this adjusted. And then once we've we've gotten that full feedback, we go to start doing the proper build with other team members that might join. It might be one, it might be two. And then the build just keeps going on and on from there in that sense. Uh so this is a key thing I want us to have within our CRM and then just integrate it you know autonomously right within the system. Let me open the floor for questions. I know it's been a lot of information and it's been here and there, but I hope it gives some form of direction on what we're trying to achieve and the steps that we're going to take to achieve. But let me answer the questions that you may have to

Technology Team: Okay. Um I think we need a bit more. So someone call okay about an issue. Um I think my first question is would this be separate or does this necessarily have to be separate or we can do it in the current year?

00:14:32

Joshua Ayo Omomia: It it should be.

Technology Team: But can we build it as function of a You said

Joshua Ayo Omomia: Yes. So my yeah my my preference is we actually build it in the CRM.

Technology Team: what?

Joshua Ayo Omomia: You know what I want that CRM to be is to is to be actually our our

Technology Team: Okay. Okay.

Joshua Ayo Omomia: brain. So the company brain. Um so as we keep proceeding, we would want to centralize everything around our process, our documents, everything in that CRM so it's easier. So yes, it should be within the CRM for long story short.

Technology Team: Okay. All right. So,

Joshua Ayo Omomia: Okay.

Technology Team: okay. Mean that we now have to edit all the entities in system to not fit this um to fit into this.

Joshua Ayo Omomia: All right.

Technology Team: Yeah. Okay. Okay. I I don't think I'll have any questions specifics yet because I think

Joshua Ayo Omomia: All right.

Technology Team: ultimatum to see how we can then merge them.

00:15:32

Technology Team: So for me,

Joshua Ayo Omomia: Okay.

Technology Team: I don't think I have any questions here.

Joshua Ayo Omomia: Okay. Okay. Emeka on um on

Timothy Victor: Yeah,

Joshua Ayo Omomia: Victor.

Timothy Victor: I'm just waiting to get to see the document, then go through it and see how we can implement the new changes. So, I don't really have a question for now.

Joshua Ayo Omomia: Okay. Okay.

Emeka: Um,

Joshua Ayo Omomia: Yeah. Emeka

Emeka: for me, um, you spoke about aggregating all of the conversations you've had with the clients and then using it to form

Joshua Ayo Omomia: Yeah.

Emeka: an opinion. So when having conversations with clients,

Joshua Ayo Omomia: Mhm.

Emeka: is it always only going to be text or are they going to be like voice notes, videos and and documents and all of

Joshua Ayo Omomia: So, good good question. Good question. Is that the only one?

Emeka: that?

Joshua Ayo Omomia: So, I can answer all of them at the time. Is that the only question?

00:16:23

Joshua Ayo Omomia: So I can answer all at the same time.

Emeka: Yes. Yes, that that's the only question.

Joshua Ayo Omomia: Okay. So um the answer is for now we would make everything only just text for now or words for now. So whether it's it could be an MD file, it could be a word document, it could be a PDF, that's that's that's what will mostly be the limits. In the future the plan will be we even just have this properly integrated into everything. So whether into WhatsApp into our our meeting um meeting rooms itself uh where we've made this like a proper company brain then it's a brain with several tentacles all over the entire system and it's speaking information everywhere storing them within the graph so we're able to map it to to what is important or not. But I don't want us to waste time building that yet. So for now it will still be manual. People will post their or we paste their information, their conversations that they had recorded.

00:17:26

Joshua Ayo Omomia: They would upload the PDFs themselves, all of those key things. And this is a sample of what that might look like. So here you have the project details, you have the client names. In some cases, if there's a template that ties with it, you can pick it or you just put a custom technology um project. You put the outcome. Now, for some meetings at the initial point, they may say the outcome is we want um a proposal. Some may say the outcome is we want a um a a meeting to discuss further. Some may say come back to us with the with what we've shared and how you want to go around it. Whatever it is, we'll put the outcome here and then we explain a bit about the brief right here. Then you end it with things like the transcript. So the source, let's say initial phone call meeting that happened on 12th June. You paste the transcript here and then you can upload documents that are necessary right here.

00:18:25

Joshua Ayo Omomia: Maybe they've shared things about the company. Maybe they've shared something about the type of project they want. Everything will be done here. And once that is done, then you create the project and then it triggers the tsd team to pick it up. So for now, it's going to just be text based.

Emeka: Okay.

Joshua Ayo Omomia: Okay. I would have expected more questions because the document is just one thing. U I intentionally didn't go into much detail on explaining this so strongly because I wanted it to be interactive. Um I sincerely don't think we've fully grasped this and uh so

Technology Team: Yeah. Okay. Sorry.

Joshua Ayo Omomia: let's that's why I said conversation. Let's so let's talk through the architecture together.

Technology Team: I was wondering the Okay,

Joshua Ayo Omomia: Don't wait for the document.

Technology Team: we should put it here.

Joshua Ayo Omomia: I'll share the document but let's uh yeah let's uh so

Technology Team: I thought it be in the document.

00:19:19

Technology Team: So, I'll read the document first. I'll not get it.

Joshua Ayo Omomia: you so the thing is because of the document is AI generated is lengthy you might not read it if you read it with understanding it's easier for you to digest it and move faster than with no understanding do you understand so so let me let me give as much understanding as

Technology Team: Okay.

Joshua Ayo Omomia: possible so you can put in one or two together when you are reading the documents that's why I called for call and I didn't just send documents. Okay. So, go ahead.

Technology Team: Okay then.

Joshua Ayo Omomia: Mhm.

Technology Team: Uh I think maybe it's a good starting point then cuz there's so many blanks in my head that's why I was saying maybe I should cuz well but I guess let's let's go um

Joshua Ayo Omomia: Yes.

Technology Team: okay um first I'll start with the let's start with the

Joshua Ayo Omomia: Okay.

Technology Team: template the template is only feeling requirements and risks as I can see on the

Joshua Ayo Omomia: Mhm.

00:20:12

Joshua Ayo Omomia: Yes. Correct.

Technology Team: screen in the project and that's okay um how do we

Joshua Ayo Omomia: Yes,

Technology Team: how what's the plan to manage changing scope because one of the things we noticed in all the periods we've been

Joshua Ayo Omomia: correct.

Technology Team: building is that um as once they have a call for example um Kenny and have a call on you start and then you probably know it's there's a new thing there's a new feature

Joshua Ayo Omomia: Yeah. Yeah.

Technology Team: there's something that needs to change um so there is already a clear what does the

Joshua Ayo Omomia: Yeah. Mhm.

Technology Team: client want in terms of yeah so in ter sense

Joshua Ayo Omomia: Mhm.

Technology Team: especially at the beginning So what's the plan for that changing that's that will be done by the

Joshua Ayo Omomia: Yes. Yes.

Technology Team: PM or has come from your end too.

Joshua Ayo Omomia: No. the for in in this thing and one thing you see in the document is um I'm completely going to pull myself out of the process.

00:21:04

Joshua Ayo Omomia: Um if you use a racy framework my my roles in projects are two things to be informed and to be consulted. I must be informed about the stages and I must be consulted but I don't I I'm going to remove myself

Technology Team: Yeah,

Joshua Ayo Omomia: from responsibility so I'm not a blocker.

Technology Team: you're not responsible.

Joshua Ayo Omomia: Yeah.

Technology Team: You're not comfortable.

Joshua Ayo Omomia: So there's no so no blocking and I'm not accountable. So I'm not a blocker to you guys finishing on time. Um so that all of that will be doing time. But before I even answer that, a good way to actually see this and I'm glad you asked that question because it's almost like the foundational fundamental part of this. The way you need to see the system and maybe I would have to redo that architecture. I will have to redo the architecture and even share it with you so it's a bit more clearer. Now there is something you call the pre-RO phase.

00:21:55

Joshua Ayo Omomia: Now let's take for example, let's use a project that is happening right now, a live project that is happening right now. Um, for the government of Barbados, they are currently building an entire CRM across the entire island, you know, all of that. And there is a tech um um um the tech group that has the contract is going to work with us to bring that to life. And the key thing that we're starting with is training AI models within their language so that they can put it in for their banking system for all of those key things. We're going to start that project very soon.

Technology Team: Okay.

Joshua Ayo Omomia: Now it's a pre- project because I've not even brought it out to you guys. Now while I was there because I was there a bit to have meetings and all of that within the last week we had many

Technology Team: f***.

Joshua Ayo Omomia: inerson meetings. I had inerson meetings with the leadership with the politicians all of those key things.

00:22:49

Joshua Ayo Omomia: Now there were information that was sent to me and I took notes there. Um day before yesterday I had a very lengthy call I think about 3 hours call with the person that's the CEO. Now that call is recorded. I have that transcript there. All of those things are pre- project because I've not even looked in the team yet. Now what would happen once I get those pre-ro details I then come

Technology Team: Okay.

Joshua Ayo Omomia: here and I put in everything. I put the name. I put the project scope. I put all of these things here. So, it's like a starting point to even create a project. Now, once I put all of that here and I put the transcript and I upload every document that is important, what then happens is that the AI has an instruction that it uses to reason across those documents and then it selects a member from the TSD team or

the delivery team as we know it to now own this the outcome and success of that project.

00:23:47

Joshua Ayo Omomia: Do you understand my point?

Technology Team: Okay.

Joshua Ayo Omomia: So that that's now with what you are talking about

Technology Team: Okay.

Joshua Ayo Omomia: um the technology team would only get involved as the project is progressing. And so let's use this our this this example I'm saying. So let's say after I've done it, I've put because I haven't even started with the documentation yet. Let's say I put in all the notes and the transcript and all of that which is required and then I share that uh you know we put that on the system. It picks a tsd member. What the TSD member may do is it will document everything and probably share a note back to the client and say based on the conversation that you shared this this this this is what you want us to do. This is how we're going to do it. You know, put all of those kind of key things. It's not a technical document. It's more or less a process and an outcome document.

00:24:44

Joshua Ayo Omomia: The client may see that and say, "Okay, that's fine. Um, let's proceed with it." What then happens next is once they say let's proceed with it and all of that the TSD member then triggers for us to get a project lead or solution architect on the project because that's the person that will be held responsible for the technical success of the project. Now what that person then does is takes that information and scopes it out and then

Technology Team: Thank you.

Joshua Ayo Omomia: conversations then starts with the client back and forth. That is where all of this you know they change the scope today change it tomorrow would happen during the system and that's why within what we've designed here if you see it here for each project there is always where's that uh created something let me see where I put there's always meant to be a section where you can you can um change you can update requirement yes so you can update you can always you know change you can see it here so So if there's a new transcript, a new thing that is here, you update it and the system is picking that information and updating the knowledge of what it has internally.

00:25:53

Joshua Ayo Omomia: So if today they said we want a system that when you press it, monkeys are flying and now tomorrow they don't just want monkeys to fly. They then want giraffes, they want elephants, the system picks it, you save it here as a solution architect, add it to your scope, but the system receives it and updates that with its knowledge. Do you get my point?

Technology Team: Oh,

Joshua Ayo Omomia: So that will be for them here. Yes. So this section here is just showing a model of what each user can

Technology Team: okay.

Joshua Ayo Omomia: see per se. All right. In that sense, but but that's that's the that's the real sense of of what it is. I don't know if that that helps a bit.

Technology Team: Yeah.

Joshua Ayo Omomia: Um good.

Technology Team: Yeah, I think that I I get that. I see.

Joshua Ayo Omomia: So ju just to recap just to recap a bit there is always remember that there is the

Technology Team: Oh.

00:26:38

Joshua Ayo Omomia: pre- project which are initial conversations. Then there is the would I call it uh the project would I call it an idealation stage where we're putting together the idea that's now when it has moved beyond myself or other people that are bringing in the project and mostly there's a team is involved. Now once there is some form of you know um firm agreement that are moving ahead with the project the TSD would now loop in who would be selected as the solution architect and the project team lead uh project lead generally for that project and then they start working on it that is now during the project build which is another phase of the project. Do you get my point? So there's also a different a different workflow on that one.

Technology Team: Yeah.

Joshua Ayo Omomia: Yeah.

Technology Team: Okay. So, sorry. One one quick question.

Joshua Ayo Omomia: Yes.

Technology Team: I wanted to map the current state. I can I'm looking at the app now.

00:27:31

Joshua Ayo Omomia: Yes.

Technology Team: I can see different functions. So, I wanted to map these functions to the ones Oh,

Joshua Ayo Omomia: Help me. No. Show me. Show me what you're seeing so that we're okay.

Technology Team: I'm looking at it on emergence. What just um what you show?

Joshua Ayo Omomia: Okay. Okay. Okay. The one I shared. Okay. Go ahead. Go ahead.

Technology Team: Yeah. So,

Joshua Ayo Omomia: Mhm.

Technology Team: I'm seeing the different um entities in the I'm trying to map them to the entities already exist in

Joshua Ayo Omomia: Yes.

Technology Team: CRM as I currently

Joshua Ayo Omomia: Yes. Yes. So, so, so and that's another good point because we are changing the entities you see there.

Technology Team: understand.

Joshua Ayo Omomia: Um, one of the things we want to do during our uh meeting in September is share with us what the final structure of the company, the new structure of the company is going to be.

00:28:12

Joshua Ayo Omomia: Um, so those entities are the ones you see on the document are the final ones. What I can do is you know what I will share a a document that explains all the different departments with you success um so it makes it easy for you to understand but just keep

Technology Team: Okay.

Joshua Ayo Omomia: that keep it within yourselves for now um because I want let's let let others hear it properly let it not be sight talk it's not a secret let it be officially communicated to everybody so but just for the purpose of this project you guys will have access to it yeah

Technology Team: August. Okay. So that means we are going to um change the CRM directly but we're not we're not

Joshua Ayo Omomia: We would we we would have to Yes.

Technology Team: trying to the current.

Joshua Ayo Omomia: We'll change CRM to what's to the final stop. Yes. Yes. Correct.

Technology Team: Okay.

Joshua Ayo Omomia: Yes.

Technology Team: Yeah. Um by the let's say okay what what's the deadline?

00:29:00

Joshua Ayo Omomia: Yes.

Technology Team: What's the timeline?

Joshua Ayo Omomia: Uh you know with everything it's it's it's a pain point. So as soon as we have it is important. I think what is most important here is I'm not looking for us to have a perfect product. I want a product that we can keep it. So the quickest we had to have something up and running is what I want. Um I sincerely think that once we understand this within 24 hours we should have um a sample product up that we can start using. uh gone are the days where we build for long then over and over as we keep using it we're now retrating and updating it and upgrading it that's that's how I see it so and I even want us to now even inculcate that within ourselves we should always have 24 hours outcomes um please remind me about that So, I'm going to um share that with the with some of the tech leaders and the wider team there must always be 24 out.

00:29:58

Technology Team: Nice.

Joshua Ayo Omomia: Yes, in this in this present day and time we can do 24 hours outcomes. It's very possible. Okay, but back to any what I'm saying. So 24 hours we should have something up um and then we'reing we're not building perfection just as we keep using it.

Technology Team: Okay.

Joshua Ayo Omomia: Yeah.

Technology Team: So, that that means um if we Okay, I guess we'll just have to clone I guess we just have to clone the CR

Joshua Ayo Omomia: Yeah.

Technology Team: then change it because I was thinking should we shouldn't have to stop

Joshua Ayo Omomia: Yeah. We don't have to stop it. Well, what is most important is you guys understand it because once you have the understanding,

Technology Team: current.

Joshua Ayo Omomia: you you know the system, you understand it end to end, then it's easy to just execute it immediately. So I don't mind us spending that time having calls going through it together and I'm just explaining it how it is in my head and we we put it down better.

00:30:58

Joshua Ayo Omomia: Yeah.

Technology Team: Okay. Okay.

Joshua Ayo Omomia: Yeah.

Technology Team: So, I I saw something.

Timothy Victor: That's

Technology Team: I saw

Joshua Ayo Omomia: Yes. Yes. Yes. Yes. Good question.

Technology Team: tsd.

Joshua Ayo Omomia: So um that department as I mentioned is delivery. Um it's actually service delivery and within the service delivery there are two Sorry. So within the department there are two. There are those that are focused on talent which was a strong part of what we've been doing and then there are those that are focused on um technology service delivery. So those are the two. So that's why it's also called 2TSD. All right. So technology and talent service delivery.

Technology Team: Okay. So like uh cuz what I'm seeing I can see they're like separate

Joshua Ayo Omomia: That's what I'm saying. Yeah.

Technology Team: here is what I'm saying.

Joshua Ayo Omomia: Yeah. So, there are two there are two units within the delivery team.

00:31:59

Technology Team: Okay. There are two

Joshua Ayo Omomia: There's the techn Yeah. Two subunits.

Technology Team: subunit.

Joshua Ayo Omomia: Yes. There's the technology service delivery. There's the talent service delivery. There are going to be different people in those two different units.

Technology Team: Okay.

Joshua Ayo Omomia: Do you understand?

Technology Team: Okay.

Joshua Ayo Omomia: Yeah.

Technology Team: Okay. So okay then um the knowledge the knowledge thing I'm saying too it seems like that's something like um what we're trying to do with the foundation

Joshua Ayo Omomia: Yes. Yes. Yes. Correct.

Technology Team: right okay so do

Joshua Ayo Omomia: Correct. Correct. Correct. The the the world I seen. Go ahead.

Technology Team: we intend please go

Joshua Ayo Omomia: Go ahead. Go ahead. No, no, no. Go ahead. Ask the question.

Technology Team: oh no I was just going to say do we intend to um finalize foundation that be the product foundation So then the crowd um

00:32:46

Joshua Ayo Omomia: No, not yet. No, not yet. Not not yet because I also know what is feasible. Um, and as I said, I want you guys to achieve your 24 hours outcomes. So, No, not yet. Not yet. Not yet.

Technology Team: Okay.

Joshua Ayo Omomia: This is if I Yeah.

Technology Team: Keep institutional as a fist.

Joshua Ayo Omomia: What do you say as a

Technology Team: I said we can keep institutional knowledge as a

Joshua Ayo Omomia: future? Yes.

Technology Team: future.

Joshua Ayo Omomia: As a future thing. Yes. Yes. But it's going to be important. Yeah. Any other question?

Technology Team: I'm good. I think that's I'm going try to go through the app to see the different points

Joshua Ayo Omomia: Okay.

Technology Team: for portfolio

Joshua Ayo Omomia: Okay.

Technology Team: control. So is portfolio control tower.

Joshua Ayo Omomia: Um portfolio control tower.

Technology Team: What is it supposed to

00:33:51

Joshua Ayo Omomia: Okay, good.

Technology Team: do?

Joshua Ayo Omomia: So what this is meant to do is so it shows so this is my a single account you're seeing. It shows every single um um project. I may adjust some things there that are not necessary but it shows every single project where they are whether they at risk all of those key things. Um I think what would just happen is depending on

the access rights there are different access rights to what you can see and what you can see.

Technology Team: Okay.

Joshua Ayo Omomia: So yeah yeah so but it's meant to be it's meant to be like a dashboard and a

Technology Team: Okay.

Joshua Ayo Omomia: snapshot of all the things I can see where they are what they are all of those key things. Um, I wanted it to show to be like a central database. Um, but I may just think about the type of information that I want to expose there. Uh, until I'm I have a good sense of of a trust of those that are going through the system.

00:34:50

Joshua Ayo Omomia: Okay.

Technology Team: Oh,

Joshua Ayo Omomia: Mhm.

Technology Team: okay. Okay.

Joshua Ayo Omomia: Yeah.

Technology Team: Um the for the talents I'm seeing um on the talent SD page I can see projects that have

Joshua Ayo Omomia: Yes. Good. Yes.

Technology Team: been is that for sourcing talent from like the

Joshua Ayo Omomia: Yes. Good. Yes. So,

Technology Team: 35,000

Joshua Ayo Omomia: it's for the talent SD to come there more or less and be and and um update the talents that are required and those that you've added because how we're going to do it in in in the full sense of this is a lot of our talents that we work with will depend on the project and not all of them will be full-time as we are even currently doing with IHS. A lot of them will be will be contracts. So meaning we work with you

maybe for 2 months. Your contract is renewable every month and after 2 months or 3 months that's that's all.

00:35:49

Joshua Ayo Omomia: Bye-bye if they did buy the project and you get going. Now because of that the team would have to get those talents um because we have a huge database. So this is where they come and indicate that just to keep them accountable.

Technology Team: of of A which means that these talents will have to have accounts within the

Joshua Ayo Omomia: Yeah. No,

Technology Team: system.

Joshua Ayo Omomia: the the talent SD needs to have account. The talents don't need to. What I was thinking here though was uh I know one of the things that adoption was told to work on that time was the recruitment um system. you remember it recruit flow which adoption had done this is where recruit flow then

Technology Team: request.

Joshua Ayo Omomia: becomes important okay so this this should be connected to recruit flow the world I is that as a new as a when I'm working with the talent SD

Technology Team: Okay.

Joshua Ayo Omomia: team I get the brief of what is needed from the solution architect and from the um from the technology SD I come to the system activate recruit flow to check our database and pick the people that are necessary within our database then I can have conversations with them.

00:36:59

Joshua Ayo Omomia: So that way they already in the system. I know one thing Victor did and I'm not sure Victor can you still hear hear me here?

Timothy Victor: I can hear

Joshua Ayo Omomia: One of the key things that I know Victor had done was you had integrated our our database

Timothy Victor: you.

Joshua Ayo Omomia: to to the current CRM right so making it very easy

Timothy Victor: Yes.

Technology Team: Yes.

Timothy Victor: Yes, sir.

Technology Team: Yes.

Joshua Ayo Omomia: and that answers your question. Uh they don't need to have accounts but they are in the system already and we can pick

Technology Team: Okay.

Joshua Ayo Omomia: them.

Technology Team: Okay. And then they don't need to view. I was asking because I was wondering they need to view projects and like update status, but I guess like you said before that'll be on the talent.

Joshua Ayo Omomia: Uh no view view and update project like

Technology Team: SD side.

Joshua Ayo Omomia: view the the project right.

Technology Team: Yeah. And I as update is oh I've done this, I've done that stuff like that.

00:37:47

Joshua Ayo Omomia: Okay. Okay. Okay. I get you. I get you. Okay. Yes, you are right. They then they will need to have account. You're right. Because there will be a need for them to update. Correct. Correct.

Technology Team: Yes.

Joshua Ayo Omomia: Yes. Yes.

Technology Team: Okay. So,

Joshua Ayo Omomia: Yes.

Technology Team: there will there will be there will be there will be a new um like a separate

Joshua Ayo Omomia: Yes.

Technology Team: entity.

Joshua Ayo Omomia: Correct. Correct. So, so no, no,

Technology Team: Okay.

Joshua Ayo Omomia: I don't think there will be a separate entity. There's going to just be the engineers part under the functions. And what we can do is we can make the Yeah, there'll just be an engineer's part. Um,

Technology Team: Okay. They'll just see only their projects as

Joshua Ayo Omomia: so just their project and they update it.

00:38:26

Technology Team: engineers.

Joshua Ayo Omomia: Then it it feeds into the general system.

Technology Team: Okay.

Joshua Ayo Omomia: Yeah.

Technology Team: Okay. I see. I see. Okay. I see. Um dependency map technology point.

Joshua Ayo Omomia: So

Technology Team: Oh, what what more points? Sorry.

Joshua Ayo Omomia: good good question. Now for Every project that we do they will be broken down into pods. Let let me share for for the knowledge of those of us on the call. The way we're going to do the team now there are going to be four parts and let me talk on technology. There are going to be four parts of the team. There is the part of the team that we refer to as the foundry. And in the foundry members of the

technical team of the foundry are really involved in our research training the models and then also um um building our internal projects. So all our internal tools they would be in charge of it.

00:39:37

Joshua Ayo Omomia: There will always be someone in the foundry that that is involved in our internal project. Um because there's always an integration with our models that we train internally. Now there is now the frontier team. The frontier team is the implementation and deployment team. That's the team that works directly with the clients to actually build out the now in that implement in that and we call that the frontier team. All right. Now within that frontier team we typically have people that serve as you know architects and and and and builders that know how to to code. Um we would have also engineers better junior mid-level all of that. Um the point is what they do are two core things. The first one is all the projects that we have that we're implementing with the clients, the frontier team works with the delivery team to bring those projects to life. That's number one. Um and also work with the um um works with the foundry team to implement all of this our AI and the models that we've done into it.

00:40:42

Joshua Ayo Omomia: The second part is they also support the frontier team in bringing our internal projects to life from a build perspectives at scale. Okay. Then the third team is the firewall team.

Technology Team: What's

Joshua Ayo Omomia: Now what the firewall team is going to do going forward is things on security,

Technology Team: this?

Joshua Ayo Omomia: QA, product design um and just being within our guidelines that team now manages that. So there you see things around our cyber security, our product designers that some that will be joining very shortly. Um uh our QA and all of that will be there. That's another part of the team. Then the last is going to be the fabric part of the team which is hardware. So they do things like some of our um drone projects that we're going to get very shortly, the IoT projects that we'll do with some members of the government in future. Some of the warehouse robotics we will do that will be based on them.

00:41:37

Joshua Ayo Omomia: Now a pod is usually made up of team members from all of that team. In most cases what we would see in a pod is there would be the person that will serve as the solution architect and technical project lead for that project. That may most likely be someone from the frontier team. Now the person might be added by someone from the foundry team because there's maybe a need for models, model training, all of that. The person might be supported by another junior engineer from the frontier team. The person might be supported by the cyber security person that will lead the security part of the team or the product designers that will ensure that we are right within the right UI um design system that we have in place. All of these team members now form a pod And it will vary depending on projects. So that's the pod. Do you understand? Um.

Technology Team: Okay. Okay. I see. I see.

00:42:35

Joshua Ayo Omomia: Uhhuh.

Technology Team: Um Okay. Well, but that that will not be necessary now. Although or would it because I'm I'm not seeing any distinction within the app currently across these four um visions cuz

Joshua Ayo Omomia: Uh no no no that will be necessary. We're looking at it not not the divisions now but the functions.

Technology Team: currently

Joshua Ayo Omomia: So the app the app is emphasizing on functions for now not divisions. So meaning I may even if I'm in the frontier team I'm an engineer. Even if I'm in the found the foundry team I'm also an engineer. So you are an engineer on the system. Do you get my point?

Technology Team: Okay,

Joshua Ayo Omomia: Yeah. Yeah.

Technology Team: previously import just refers to the group of engineers

Joshua Ayo Omomia: People working on Yes.

Technology Team: for

Joshua Ayo Omomia: The group of people not only engineers it also have the TSD member in the port is the entire group of people working on that project.

00:43:39

Joshua Ayo Omomia: Yeah.

Technology Team: clear.

Joshua Ayo Omomia: So is a project

Technology Team: Okay, I see.

Joshua Ayo Omomia: code,

Technology Team: So, what we'll be doing in um this this will all be built out into CRM. So,

Joshua Ayo Omomia: correct,

Technology Team: we're going to integrate that we'll be trying a bit of foundation but not

Joshua Ayo Omomia: correct, correct. Yes.

Technology Team: yet.

Joshua Ayo Omomia: Yes. So there are going to be several elements of foundation in it, but but yeah, not not the full foundational build yet. So

Technology Team: But if we're going I mean going going into the future would it would it be built would we have those like the knowledge graph and all in this system or just use foundation.

Joshua Ayo Omomia: No in in this you know foundation itself is an updated a huge part of foundation is the knowledge graph. So so yes it will be inbuilt in the system because foundation will be in the system for us

Technology Team: Yes.

Joshua Ayo Omomia: to have a company brain there must be foundation that's the only way it can work.

00:44:36

Joshua Ayo Omomia: So yes, foundation will be part of the CRM.

Technology Team: Okay. Okay.

Joshua Ayo Omomia: Yeah.

Technology Team: Um I'm trying to go through the project um life life

Joshua Ayo Omomia: Okay.

Technology Team: cycle as it as it is in the app now.

Joshua Ayo Omomia: Mhm.

Technology Team: Um see the depth chart. solution architecture canvas. Do they would we intend that the social does the system on the

Joshua Ayo Omomia: Um,

Technology Team: app

Joshua Ayo Omomia: not necessarily, but the person would submit it on the app. He doesn't need to build it on it.

Technology Team: so they can submit it as a

Joshua Ayo Omomia: Yes. As a diagram.

Technology Team: diagram.

Joshua Ayo Omomia: Correct. Correct. I would even prefer that.

Technology Team: Okay.

Joshua Ayo Omomia: I would even prefer maybe submitted as some form of a markdown file so it's easy for the system to to dig but it doesn't matter even if it's a diagram system will understand it. So yeah they can upload it can upload it as a as a PDF or as a as a JPEG.

00:45:42

Technology Team: Okay,

Joshua Ayo Omomia: Yeah.

Technology Team: because I'm looking at that something we have to do then because currently I understand only you can build it here. You can like upload it.

Joshua Ayo Omomia: You can upload which one?

Technology Team: I was just looking at it and you can't

Joshua Ayo Omomia: Yes.

Technology Team: upload

Joshua Ayo Omomia: Yes. Yes. We'll adjust that. We adjust that.

Technology Team: and then the test will be like the bound like the

Joshua Ayo Omomia: Correct. Yes. Yes.

Technology Team: work.

Joshua Ayo Omomia: The Trell kind of camp board that we already have.

Technology Team: Okay,

Joshua Ayo Omomia: Um Victor, do me Victor,

Technology Team: we already have that.

Joshua Ayo Omomia: do me a favor and just put that up on the screen, please. Let's let's see the current um Trell board that we have. See, is Victor

Technology Team: since he he joined on his phone.

Joshua Ayo Omomia: there?

Technology Team: So he take a minute to join. Can I do it here?

00:46:35

Technology Team: His system is updated.

Joshua Ayo Omomia: Okay.

Technology Team: So let me see if I can share my screen from here.

Joshua Ayo Omomia: So, okay.

Technology Team: Um so oh I I'm an engineer so you said was like for the engineering side what what about the client

Emeka: If you want to keep the client updated on the project,

Technology Team: side

Emeka: how do we do that?

Joshua Ayo Omomia: Mhm. Good. Good.

Emeka: And then to the

Joshua Ayo Omomia: Okay. Go ahead.

Emeka: project, how do we

Joshua Ayo Omomia: And what?

Emeka: really

Joshua Ayo Omomia: I can't hear you. I can't hear you.

Technology Team: You should see each

Emeka: make changes to the project? How do they how do they communicate the changes to us?

Joshua Ayo Omomia: Mhm.

Technology Team: other.

Emeka: And does that affect the flow of the

Joshua Ayo Omomia: Good. Okay. So, this is what we will do. Um, every other thing can come from multiple sources that we can control. But one thing that we can't control the information is the client.

00:47:32

Joshua Ayo Omomia: So, that's why we must make it a single source of truth.

Technology Team: Let's

Joshua Ayo Omomia: How the client communicates these changes. Now what's going to happen is that as it stands now the client mostly communicates their changes, their needs,

Technology Team: go.

Joshua Ayo Omomia: whatever they want to the tsd so that there's just one single source of truth. The TSD will now be in charge of taking that information that they've shared and they put it in the system for us to receive. and will still maintain that structure. Do you understand? So they may share to the tsd through a phone call, through an email, through a WhatsApp, whatever means they send it. It is the respons responsibility of the tsd to take that information and put it in. Does that answer you?

Emeka: Yes. Yes, it does.

Joshua Ayo Omomia: Okay. Okay. Um, is is Victor finding it hard to share? You said his laptop is updating, right?

Technology Team: Yes.

00:48:29

Technology Team: So, so can you hear me?

Joshua Ayo Omomia: I can hear you loud and clear.

Technology Team: Okay. Oh, yeah. So, I'm trying I'm trying to log in on my own PC because currently I I'm not an admin.

Joshua Ayo Omomia: Yes.

Technology Team: I'm not a project manager on the like my account is not. So, I guess let me try to log in with account. So, um then I think I'll be able to show a minute

Joshua Ayo Omomia: That's true. Where is Annabel?

Technology Team: please.

Joshua Ayo Omomia: I should have even added that to the

Technology Team: He is

Joshua Ayo Omomia: call.

Technology Team: here.

Joshua Ayo Omomia: Annabelle, how's it going?

Technology Team: Sorry. So, should it do you mean we should add her?

Joshua Ayo Omomia: No, no, I can't see. You said she's here or something, right?

Technology Team: Okay. I mean I mean she's around like should should I

Joshua Ayo Omomia: I I didn't Okay. No, no, no. Just just I I I know she wasn't maybe give her like I don't know if it's an air piece or what you are using.

00:49:37

Technology Team: go

Joshua Ayo Omomia: Let me just Annabelle how you how are you feeling?

Technology Team: I'm very s

Joshua Ayo Omomia: Uh okay. I I didn't know you had you back already. Okay. I I will check in later. Let's I know you are still recuperating. Uh we'll talk later. All right. Well done. Yeah. Yeah. Okay. Um success. So just back to you s.

Technology Team: I've forgotten the password. So I'm I'm

Joshua Ayo Omomia: Okay. So that we can share it. You see? So this this is what you you see why I was saying that one thing I want us to do is this

Technology Team: Yeah.

Joshua Ayo Omomia: conversation is important because then it makes the document easier for us to digest it than reading the document. Document is just an AI generated version of what we're talking about.

Technology Team: Yes.

00:50:43

Technology Team: Okay. So, I don't think we need to change. Okay. Let me share my screen. This thing is I'm so confused. Why is this thing? I'm serious. It's not It's not Let me see. Okay.

Joshua Ayo Omomia: Uh-huh. Okay.

Technology Team: see my screen.

Joshua Ayo Omomia: I can see it loud and clear.

Technology Team: Okay. Okay. All right. So,

Joshua Ayo Omomia: Yeah.

Technology Team: I think I'm not I'm not sure. Okay. All right. create what you're currently working on. I'll assign a score on this particular. Okay. And once we do these changes, the engineers working on the project get the update on their task board and also via email. I got right

Joshua Ayo Omomia: So yeah,

Technology Team: now.

Joshua Ayo Omomia: so what should be happening is that as we are updating it from there, it should be directly connecting to the camp board and is updating it. Do you understand?

00:53:01

Technology Team: Okay.

Joshua Ayo Omomia: Oh, that's good.

Technology Team: Sorry.

Joshua Ayo Omomia: Do you want me to go

Technology Team: Yeah. I'm I'm wondering do you want the current because what I was thinking was that um

Joshua Ayo Omomia: ahead?

Technology Team: what we've been doing is purely conceptual but like we're going to implement them in this CRM. Would you do you want it to still look the way it looks there?

Joshua Ayo Omomia: Do you mean this?

Technology Team: And um yeah,

Joshua Ayo Omomia: Do you mean the CRM or the the delivery system?

Technology Team: the delivery system I mean do you want us

Joshua Ayo Omomia: So the the delivery system is all conceptual.

Technology Team: to

Joshua Ayo Omomia: We're bringing we're folding the delivery system into the CRM. Yeah. Yeah. Into the CRM. Yeah.

Technology Team: Okay,

Joshua Ayo Omomia: The CRM is the single source of truth. Yeah.

Technology Team: you can add Yeah. Yeah. Yeah. Yeah.

Joshua Ayo Omomia: Mhm.

Technology Team: Yes.

00:54:02

Technology Team: Okay. Like social project I guess all these coordinator all this language we have to change. different

Joshua Ayo Omomia: Yeah.

Technology Team: stages. Okay. I think maybe what we need now is few hours to read the stuff and then so I'll look through the current so we know how we map

Joshua Ayo Omomia: Mhm. Good. Good. So, so that's what I want. So,

Technology Team: this

Joshua Ayo Omomia: I want that. Let's do that and at least by tomorrow morning, let me see a plan on how I want to achieve it and then immediately we start our 24 hours outcome. Again, success remind me that thing. I want as I said it's going to be common place for us now. Um there must be 24 out 24 hours outcomes for for all the projects we do. Every 24 hours there's an outcome. All right. So um so the outcome for the next 24 hours for this project is I want to see the um I want to see our understanding and how we want to go around it within the next 24 hours and then we'll take it off from there.

00:55:39

Joshua Ayo Omomia: Okay.

Technology Team: Okay. Yeah. Sorry. Sorry.

Joshua Ayo Omomia: All right.

Technology Team: By the way, um the GitHub thing I met I already met Manu and the issue is that

Joshua Ayo Omomia: Uhhuh.

Technology Team: um we already um we're already a GitHub team account.

Joshua Ayo Omomia: Yes.

Technology Team: I mean organization.

Joshua Ayo Omomia: Yes.

Technology Team: So the only next step from there is to go to enterprise which is going to cost around \$21 per

Joshua Ayo Omomia: Yes.

Technology Team: member of the so but I don't need that.

Joshua Ayo Omomia: Wow. You know what?

Technology Team: I don't think we need that going forward. I think the only thing was that because um the of how heavy atom code it

Joshua Ayo Omomia: Okay.

Technology Team: was in building that was what took all the um action

Joshua Ayo Omomia: Okay.

Technology Team: minutes but like it's not I don't think I I don't think to be a very frequent

Joshua Ayo Omomia: Okay.

Technology Team: thing so I don't think we need to go to that

00:56:30

Joshua Ayo Omomia: Okay. So, do do anything that can save that can save us cost.

Technology Team: much

Joshua Ayo Omomia: Um, one thing we're going to do is tread a bit carefully. We've spent so much on tools this past couple of months, so we need to tread carefully. I I want us to have a sense of a budget. So, we might just be doing it as we are doing the last time.

Technology Team: Yes.

Joshua Ayo Omomia: Oh, I need 500. We throw it. I need 50. It's not We're doing an analysis and it's it's it's a huge it's a huge hole for us. So let Let's let's let's Yeah, go ahead.

Technology Team: The issue I was like but then the issue now is that on back

Joshua Ayo Omomia: Mhm.

Technology Team: end the database is in a virtual net like

Joshua Ayo Omomia: Okay.

Technology Team: you can't access it from

Joshua Ayo Omomia: Okay. So, just what what is what is the best thing we can do now that can solve that thing?

00:57:11

Technology Team: outside to solve

Joshua Ayo Omomia: Good afternoon, Joshua.

Technology Team: it now probably the only way I can think of now is that we do this um enterprise thing once and then or we

Joshua Ayo Omomia: and then we change.

Technology Team: tell exactly

Joshua Ayo Omomia: So we do it once and then we change back after for the next month. Okay. So, so right

Technology Team: yes or we tell I was like oh

Joshua Ayo Omomia: now

Technology Team: we tell I'm to wait for a bit and when next month comes we can help

Joshua Ayo Omomia: h you know you know even even that wait for a bit me myself I also want us to actually get it out um a reason being is are you seeing our our bill I I wake up every morning and I look at

Technology Team: I've seen

Joshua Ayo Omomia: that thing it's it's it's ridiculous so um and I look at the major cost

Technology Team: it.

Joshua Ayo Omomia: spenders talent nation and IHS IHS is understandable that one

Technology Team: Yes.

Joshua Ayo Omomia: is fine IHS is a project that is being paid for so that's fine um talent nation we are we are being part of the project so it's it's something we need to cut minimum cost to it do you get what I'm trying to say now this is what can happen if we

00:58:24

Joshua Ayo Omomia: are saying to move it we need to move it to \$21 how many people in our GitHub

Technology Team: Yes.

Joshua Ayo Omomia: now are they up to

Technology Team: Uh I'm not It should be like 9 or 10 or 14.

Joshua Ayo Omomia: 9 or 10.

Technology Team: Let me see.

Joshua Ayo Omomia: Oh yeah,

Technology Team: I'm not sure.

Joshua Ayo Omomia: just check check it.

Technology Team: Let me

Joshua Ayo Omomia: Let's see. Adoption has an admin account on our GitHub.

Technology Team: Um,

Joshua Ayo Omomia: So if we need to see everything maybe you might not be

Technology Team: okay. Cuz I Yeah, I just remember I won't be able to see.

Joshua Ayo Omomia: able to is adoption there?

Technology Team: No, he's he's not here. He's upstairs.

Joshua Ayo Omomia: Okay. Call.

Technology Team: Well,

Joshua Ayo Omomia: Okay. No, you can see.

Technology Team: I think I can.

Joshua Ayo Omomia: Yeah, you can see it here.

Technology Team: One, two, three, four,

Joshua Ayo Omomia: Okay.

Technology Team: five,

Joshua Ayo Omomia: Yeah.

00:59:04

Joshua Ayo Omomia: So,

Technology Team: six,

Joshua Ayo Omomia: I've seen Yeah,

Technology Team: seven,

Joshua Ayo Omomia: that's that's Yeah, that's that's about about 12 of

Technology Team: 12.

Joshua Ayo Omomia: us.

Technology Team: Okay.

Joshua Ayo Omomia: Okay.

Technology Team: You mean drop some people for like a day

Joshua Ayo Omomia: No, no, no. We'll drop some people for it since everyone is interacting with it.

Technology Team: or

Joshua Ayo Omomia: Um, so 12, if we say 12 time, how much did you say it is? 21, right?

Technology Team: one?

Joshua Ayo Omomia: That's that's like 249 250 about.

Technology Team: Yes.

Joshua Ayo Omomia: So, and that's US dollars, right?

Technology Team: Yes.

Joshua Ayo Omomia: All right. 252.

Technology Team: 252.

Joshua Ayo Omomia: Let's let's um and if we do this, we can now push the talent nation thing away, right? Like we can push it for them to their Okay.

Technology Team: Yes.

Joshua Ayo Omomia: Okay. Okay. Let let's let Let me come back. Let me come back on that.

00:59:59

Joshua Ayo Omomia: That's number one. The second one is as much as we are also moving it, I don't want us to completely discard it. You know, I I remember I told you we're going to do this most likely for Money Point when it closes and also for another university that has a partnership with United Nations. So, it's still going to be this our platform that I'll put there.

Technology Team: Yes.

Joshua Ayo Omomia: So, we're taking it off, but we are not discarding it when those ones close.

Technology Team: Yes.

Joshua Ayo Omomia: Okay. Okay. Perfect. Perfect. And I I I'll give you feedback on that before close of business today. Then you can then talk to Emanuel to action it.

Technology Team: Okay.

Joshua Ayo Omomia: Okay. Okay.

Technology Team: Yes. So, um, so you're going to send the docs for

Joshua Ayo Omomia: Outside the document.

Technology Team: this on the

Joshua Ayo Omomia: I would also readjust the the diagram so it's a bit clearer

01:00:47

Technology Team: diagram.

Joshua Ayo Omomia: then. Um,

Technology Team: Okay.

Joshua Ayo Omomia: so just give me some I'm going to wait for this transcript of of our conversation to to be done so I can quickly use it to edit some of the things that I've shared. So once I shared that of you, I'm also going to edit that um that mockup.

Technology Team: Okay.

Joshua Ayo Omomia: You can see I just I think I just did the mockup very early this morning. I think about 3:00 a.m. you guys time. So it's it was very raw. So I'm going to now edit it a bit more clearly um to to some of the things we have there. So I will adjust I'll adjust some things look at it again give a second look adjust it but I'll do all of that today so that at least you guys can keep up with your 24 hours timeline.

Technology Team: Oh,

Joshua Ayo Omomia: All right of the first outcome which is the document.

Technology Team: sorry.

Joshua Ayo Omomia: So sharing this is what we're meant to do. This is how we're going to go around it. Um and then once that is done then we'll move again to another 24 hours.

Technology Team: Okay,

Timothy Victor: What?

Joshua Ayo Omomia: All right,

Technology Team: we'll be I'm trying to see how we can integrate the current serum while we

Joshua Ayo Omomia: correct. Correct. Why you wait on that? Good, good, good. All right. Well done, guys.

Technology Team: wait.

Joshua Ayo Omomia: This is a very important part of the of the system and it's taking us a step closer to to that our general uh system brain more or less within the firm. So, all right.

Technology Team: Yes.

Joshua Ayo Omomia: Great. Byebye, guys. Yeah.

Technology Team: Okay. Any truth?
